
Install Guide — Getting the App onto a Tester's Phone

The honest truth: getting someone onto the app is genuinely easy on iPhone and only slightly more involved on Android. The single most useful thing you can do is ask each person one question first — “iPhone or Android?” — and then give them the matching two steps below. You can paste the relevant section straight into a text or email.

FIRST, THE ONE QUESTION THAT SAVES YOU EVERY HEADACHE

“Is your phone an iPhone or an Android?”

- **iPhone** → it's on the public **App Store** now. They search “Milk Before Meat” or tap one link. Nothing needed from you in advance. Easiest path.
- **Android** → you need their **Google account email** *before* they can get in, because you add them to the tester list. Slightly more setup, but still about two minutes.

Knowing this up front means you never send an Android person an iPhone link, or promise a one-tap install to someone you first need an email from.

IPHONE INSTALL (APP STORE) — THE EASY PATH

The app is live on the public App Store — no TestFlight, no invites. Send the person these steps:

1. On your iPhone, open the **App Store**.
2. Search **Milk Before Meat** — or tap this link on your phone: <https://apps.apple.com/app/id6783621048>
3. Tap **Get**. Milk Before Meat appears on your home screen like any other app.

That's it. No email needed from them in advance, no list to add them to. If you're putting it on the Bishop's iPhone in person, you can just do these steps for him while you're sitting together — about sixty seconds.

ANDROID INSTALL (GOOGLE PLAY INTERNAL TESTING) — TWO SMALL STEPS

Android requires one extra thing: because the app is in Google's “internal testing,” each tester's **Google account email** has to be on the tester list before they can install. So there are two parts — one you do, one they do.

Part 1 — what you do (once per person): - Get the person's **Google account email** (the one tied to their phone's Play Store — usually their Gmail). - Add it to the **MBM Testers** list in the Google Play Console (Testing → Internal testing → Testers). *Cameron — if you want, a future session can walk you through this screen, or do it with you; it's a one-time add per email.*

Part 2 — what they do: 1. Make sure they're signed in to the Play Store with that same Google account. 2. Tap this opt-in link on their phone: <https://play.google.com/apps/internaltest/4700576250998456373> 3. Tap to **become a tester**, then tap the link to **download it on Google Play**, and install like any normal app.

If they tap the link and it says they don't have access, it almost always means the email you added doesn't match the Google account their phone is actually signed into — double-check that one thing first.

QUICK REFERENCE FOR PUTTING IT ON THE BISHOP'S PHONE IN PERSON

If the Bishop has an iPhone: Just install it from the App Store for him on the spot. One minute, done, he's holding it.

If the Bishop has an Android: You'll need a moment of prep — ask for his Gmail before or at the start of the meeting, add it to the tester list (this can be done from your phone or laptop in the Play Console), then have him tap the opt-in link. If adding him on the spot feels fiddly during a short meeting, it's perfectly fine to say: “Let me get you set up to try it yourself this week — what's the Gmail on your phone?” and have it ready for him within the hour.

A NOTE ON WHICH LINKS ARE WHICH

- **iPhone / App Store (public):** <https://apps.apple.com/app/id6783621048>
- **Android / Play internal test:** <https://play.google.com/apps/internaltest/4700576250998456373>

These are the current, working links as of July 2026. The iPhone app is fully public on the App Store. Android is still in Google's testing track while we complete their required closed-test period — so Android testers still need the email + opt-in step above.
